

wrong server name

During a test setup of replication on SQL2005, I received an error indicating that I had to connect to the server with the actual server name (and then it gave me the name). Problem is that the computer name actually changed after SQL2005 was installed so I am now connecting with the actual server name but SQL doesn't see it that way. Also, the old name will not allow any connection either (i.e. the name the error gave me it was looking for).

So, is there a way to modify the internal server name that SQL thinks it has?

Thanks,

Shawn
