We are trying to configure WANSync to replicate databases from two separate SQL servers to a single SQL Server with two Instances of SQL Server.

The replication work OK with one minor exception. WANSync doesn't seem to know about the second SQL Instance. I know that this should be a simple configuration change, but I can't find it.

Does anyone have experience with WANSync and multiple SQL Instances?

Any help would be appreciated as I know this is sort of off topic.
