This is always a tough question... I would google it.... and I would also check the web sites of each of the vendors, each vendors site will usually have a comparison and show the weak points of the competitor..

The TPC web site will show some comparative performance information, but don't choose based on a single test.... Each vendor ups the other, and the top spots change from one vendor to the next, like a ping pong game... Look for trends – ie for small data warehouses does one vendor seem to lead everywhere.... What about for extremely large warehouses, etc.... you can also sometimes get a feel for what hardware works well for a particular DBMS from the TPC numbers as well..

Then do your own testing... compare the prices, support policies, ease of use and maintenance, availability of skilled people to program using the db, etc and pick what you feel is best...

Now days, almost all of the products are so good you can be successfull with any of them, so just pick the best fit..
