We are using Sybase ASA and SQL Server 2000 on the same machine.

Installing SQL Server 2000 AFTER installing Sybase (8.0) did not cause any problems. Both are working fine.

But installing Sybase ASA 8.0 after installation of SQL Server 2000 caused problems with the ODBC dlls. We had to exchange the ODBC32.dll to get the SQL Server work again. Obviously Sybase overwrites these dlls but SQL Server needs them.
