well, i'd rather not to change the system stored procedure since that would mean i have to change that particular sp on all servers!

i'd prefer a solution to control the display.

i was calling the sp thru SQL pass thru in Access and return the query result to display in an Access report. (the query set, not the error msg)

One option can be to copy the source
> *code for the proc and modify it so it doesn't return that error message (I assume that there's a RAISERROR with that error somewhere in the source code).*
