If you are using proper permissions in place then from the sysobjects table you can query something like:

Select User_name(uid), name from sysobjects

and get user who created the same. If the user is a system admin then the user name will be dbo.

> *table.*

The crdate in the sysobjects will hold the creation date. This WILLNOT change unless the object was dropped and recreated. This is the only option. The only value that changes on modification is the base_schema_ver value. Hence if you have a snapshot of the table with these two columns you can find out which are modified and which tables are re-created.
