Hello,

I'm new to MS Reporting Services so please forgive the newbie question.

I downloaded the trial version from the microsoft website. When I ran the installer on my database server (SQL Server 2000, SP3) it gave me 2 warnings saying 1) Visual Studio.NET was not installed, and, 2) IIS was not configured correctly (i'm running Windows 2003 server w/ IIS6).

First of all, why would I want to install those two components on a database server?

Anyways – it allowed me to proceed so I did and then I noticed that it only gave me the option to install CLIENT tools. SO, my question is: Is there a "server" component that needs to be installed on the database server? If so, where do I download it from because I cannot find it anywhere.....

very confused.

thanks in advance,
-ZD
