It is not clear whether you managed to run that procedure to completion.  
Could you clarify?

On the other hand, why not start using the BACKUP and RESTORE commands from  
Query Analyzer, for better control?

Is .NET important for a database professional?

<http://vyaskn.tripod.com/poll.htm>

"Colby" <anonymous@discussions.microsoft.com> wrote in message  
news:1e18301c45548\$b4ad0260\$a301280a@phx.gbl...

It takes upwards of an hour to bring up our restore  
database window in Enterprise Manager. I have tried to  
execute the sp\_delete\_backuphistory stored procedure to  
clear the tables but it appears to hang and never  
responds. What can I do to improve the performance of the  
restore database window?

Thanks,

Colby
