Microsoft SQL Server 2000 client access license (CAL) licensing terms states:

A SQL Server CAL is required for a device (for example, a personal computer, workstation, terminal, personal digital assistant, or mobile phone) to access or use the services or functionality of either edition of SQL Server.

I have an application (exe) that accepts TCP/IP connections and stores the IP addresses of the connecting computers or other devices to a table stored at SQL Server 2000 Standard Edition database.

Do I have to have a CAL license for every connecting device?

I have an application (exe) that monitors caller numbers from a standard phone line and stores the caller numbers to a table stored at SQL Server 2000 Standard Edition database.

Do I have to have a CAL license for every calling phone?

SQL Server 2000 CAL licence information can be found at <http://www.microsoft.com/sql/howtobuy/servercal.asp> .
