Hi,

The public role is a special database role to which every database user belongs. Captures all default permissions for users in a database.

The user with public role can access only the tables / objects granted permissions exclusively to PUBLIC role.

For eg:

Hari is a database owner and he create a table customer. After creation he gave the below statement to give privilege to customer table.

GRANT select on customer to public

IN this case user inside public role will be able to access the table customer. Otherwise he can not.

--

Thanks

Hari
