What are you expecting to see in the TextData column for the SQLTransaction event? It's documented behaviour is to display "The savepoint or rollback name, if provided.", according to SQL Server Books Online:

http://msdn.microsoft.com/library/en-us/adminsql/ad_mon_perf_79tf.asp

Given that it's not common to name savepoints or rollbacks, it's probably a little unusual to expect to see much in SQLTransaction:TextData. Perhaps you should be profiling a different event – if you post back with what you're hoping to see, we can perhaps help by recommending a different event to profile?
