Hi folks,

I have this huge problem, wich is the following:

My server died two days ago and so the SCSI RAID 5 volume where the SQL database was, but i was able to recover a file backup from the database wich has almost 10 GB, and when i try to restore this file over a new database the SQL tell's me that the the file backup isn't a valid backup format and doesn't recognize the data on that file.

So does anyone knows any software that reconstructs the file backup or even take from there some tables or something like, please if you know something tell me.

Best regards,
