Nope I tested it in the EM before I added the SP. My username was the owner. I tested it again an hour later and after installing the SP and dbo was the owner.

I do not have the ability to change the account or username. I can not log into the server as a dbo or sa. It is remotely hosted by my web hosting company. My user name is a database owner but that made no difference before the SP. My only access is through the EM or the QA or through my website. The only way I can log in is with my assigned username and password as given to me by crystaltech my host company. If I change my account it is only done via email with a password and the host company must manually do it.
