Hi,

We need to do auditing on few of our tables and want to capture the following information using trigger on tables:

- 1) when was the table modified
- 2) How is table modified – from Query Analyzer(QA) or Application
- 3) If from QA – directly modified table or ran procedure

I was able to get first 2 information using getdate() and master..sysprocesses in the trigger.

How to get the 3rd information. Is any system table store this information whether the sql is run against the table directly or sql executes the procedure that modifies the table?

Thanks
