Hi I have a .NET web application that embedd crystal reports and some third party dlls and this interfaces with a Microsoft SQL 2000 dbase. The dbase contains several tables with constraints and key relationships as well as many stored procedures. Just wondering if there is a way to use Installsheild to automatically install the database on a new server for deployment. I have used the built in .NET web deploy wizard that creates an MSI file (windows starter file) that can be run from the server.

Thanks.
