What rights does a local or domain user account have to have on a Win2K3 server in order to find and use a X509 certificate that is installed in LOCAL\_MACHINE\Trusted People? I want more than one user to be able to access this certificate as well as a executable program that needs to access the certificate. There is also the possibility the program will be called by a SQL Server user account using the command shell stored procedure.

Thanks in advance

Dan Gard
