Hi,

We just bought a new server with more power.

The old one has SQL 2000 and the new one will have it to. All databases and jobs will be transferred to the new server. We will load the databases from last dump.

My concern is about the database logins, users and groups. How can I be sure that all the objects will work with the correct pid? I will not load the old masterdatabase into the new server.

Someone?

Regards,
/Daniel
