When we try to install SQL Server, we get the initial message about Windows 2003 not working with anything under version 3. We press continue and then get a new message "Microsoft SQL Server Enterprise Edition server component is not supported on this operating system. Only client components will be available for installation." The next screen offers only Client Tools or Connectivity options (Server and Client Tools option is grayed out). How do I get the opportunity to install the server component on a Windows 2003 SBS OS??
