Hello Geoff

I have made the 2nd instance to use the default port 1433 but still it doesn't seem to connect through remote location over internet.

Also I am trying to connect to the second instance with the following server name;

`server_ip_address\server_name`

I hope the above parameter to connect to the server is correct.

I get the error message "SQL Server does not exist or access denied"

Thanks
Regards,
John Mendonca
