Master, model, msdb, tempdb are also installed. User databases 'should' not be removed on un-install, so they will be in the same location after installation. But you 'should' have to attach them.

When uninstalling sql 2000 ee and installing sql 2000 se are the default databases (master, model, etc) new databases from the sql 2000 se installation? Reason I'm asking is because I installed directly to the same directory using same instance name and all databases remained there even after uninstalling sql 2000 ee.

Thanks

"Arnie Rowland" wrote:

I would detach and then re-attach. Take care to script out everything that may be located in master and msdb. Those references will walk you through the process.

Thanks for the reply. So even though I'm not actually moving the database from one server to another, I should still use the detach & attach function?
All I'm doing is uninstalling EE and installing SE on my current sql server.

Thanks

http://vyaskn.tripod.com/moving_sql_server.htm

Detach the databases, then after some of the following prep work, re-attach them.

You will need to transfer logins, etc. SQL Agent Jobs are located in MSDB and should be scripted out.

Any objects intentionally (or unintentionally) created in master need to be scripted out.

Re: Enterprise to Standard

Because of License issues, I will be uninstalling SQL Server 2000 EE, and installing SQL Svr 2000 SE (Win 2k Adv Svr). There are two instances running on my current configuration. I will include only one of the two instances on the new install to SE. I have read about detaching & attaching when moving the database from one server to another, but I really haven't found any hard information about my upcoming task. My plans were to backup the databases, uninstall EE, install SE (with same instance name that was running on EE), and restore databases. As far as my database backup, I will simply copy the database folder to another location, as well as my backup folder. When restoring the databases, should I use the mdf or .BAK files? Will all of my login accounts transfer or will I have to re-create them again? Is there anything that I left out or should consider

Re: Enterprise to Standard

before

I

begin

this task?

TIA
