Not enough information.

How many databases, how large are the databases, how many users on each database, what type of databases (OLTP/OLAP)?

We are upgrading our 2000 SQL server running Server 2003 Enterprise (x86) from 4 procs to 8. The server is currently configured with 8Gigs of RAM. Is this enough? What is the recommended amount? I am concerned that too little memory will starve the CPU's.

Thanks

Mike
