Hi,

I am building an NSIS script in order to make an install cd for the company's application.

One of the checks I have to do is whether the machine has SQL SERVER 2000 or 2005 installed.(the database engine I mean)

Is there a safe way,e.g from registry to check if one of the 2 is installed?(I mean a certain key for both versions)

Thanx in advance!!

my English are poor :(

.
