Hi

I created a self cert node.cerand installed it on the:

- server in the computers personal and trusted root cert folders
- as well as the client computers personal and trusted root authority folder

but when I run the SQL MGMT studio express and click >options> encrypt connection and connect I get:

a connection was succesfully established with the server, but then an error ocured during the pre-login handshake (provider:SSL Provider error:0- the certificate chain wass issued by an authority that is not trusted.)

how can this be if the cert is in both machines trusted authority folder?????

.
