Hi,

Generally speaking you use a domain account when you need the SQL Server service to be able to interact with other services on the network. See the following links for more info:

SQL Server – <http://msdn2.microsoft.com/en-us/library/ms143691.aspx>

SQL Server Agent – <http://support.microsoft.com/kb/907557>

Jonathan

Jim Trowbridge wrote:

Now I have to justify why we run SQL under a Local Admin account, instead of a domain user account (which is the microsoft recommendation).

Or, we will have to go through the change process to make this happen.

has anyone got arguments or opinions either way ?

.
