Fabia,

It raises that error because you did not restore your database on the mirror server in norecovery mode.

No, I did it correctly, also if I'm afraid of the "(in recovery)" label that apper close to the DB name in Management studio. Is it normal behaviour?

I tried also with a T-SQL procedure I found here:

[http://www.sqlteam.com/forums/topic.asp?TOPIC\\_ID=67626](http://www.sqlteam.com/forums/topic.asp?TOPIC_ID=67626)

Skipping the witness part, since I don't have any.

It fails on:

```
ALTER DATABASE M2
SET PARTNER = 'TCP://HP02:10112'
GO
```

again, with error:

```
Msg 1418, Level 16, State 1, Line 1
The server network address "TCP://HP02:10112" can not be reached or does not exist. Check the network address name and that the ports for the local and remote endpoints are operational.
```

while the counterpart on HP02 (the mirror) correctly executed.

-f

.
