Well, I'm out of idea why SQL Server 2008 Setup thinks that SQL Server 2005 Client Tools are installed even though they are not. Sorry.

Unless applying a special patch, you can't connect to your SQL Server 2008 instances using SQL Server 2005's SSMS.

See the following KB about this issue:

<http://support.microsoft.com/default.aspx/kb/946127>

Also, you can download and apply Cumulative Update 8 (Which is the latest one) which includes this patch I believe.

<http://support.microsoft.com/default.aspx/kb/951217/>

I checked using SQL configuration manager 2008. I have the developer edition and the express edition, plus SQL Server Analysis Services (MSSQLSERVER) and SQL Server Agent which is not running (MSSQLSERVER).

I do not have Microsoft SQL Server in my start menu list.

I opened services and there are no SQL 2005 services.

I installed the Windows Installer Cleanup and found no SQL with Version 9. The SQL 2005 backward compatibility tools have version 8.x.xxx, but I'm pretty sure that was installed with SQL 2008.

I decided to reinstall the SQL 2005 tools and they try to uninstall them again. I installed SQL Server 2005 Client tools and it installed properly. However, it did not show my 2008 instances when I tried to connect to the database in SQL Server Manager. I enable Named Pipes on both my SQLEXPRESS

Re: SQL Server Native Client is not supported on the current proce
instance and my MSSQLSERVER instance, and was still unable to connect to any
2008 instance. Is there a compatibility issue there?

I then uninstalled the SQL 2005 client tools so we could have a clean
uninstall. I ran the 2008 Client tools and am still getting the same error
message.

Help, I'm lost! I don't care if I have 2008 or 2005 tools installed, but
neither seem to be working properly in my environment.

Messages below makes me think a SQL Server 2005 instance might be still
be
installed with Client Tools on your system.

As far as I can see (from the message below) there are two instances of SQL
Server 2008 installed on your system. One of them is Developer Edition and
the other one is an Express Edition. Apart from these, there seems there is
a SQL Server 2005 instance installed. This could be a reason of an
incomplete uninstallation or something.

Do you have a "Microsoft SQL Server 2005" item on your Start\Programs
list?

If so, what items are there under that menu item? Configuration Tools,
Performance Tools etc.?

And can you open Services MMC (Start\Run = services.msc) and ensure
there is
no any other SQL Server services except for your Developer and Express
Editions of SQL Server 2008?

If you are sure there is no any SQL Server 2005 services, then I can suggest
you to download Windows Installer Cleanup Utility and run it to clear all
unnecessary SQL Server 2005 installation related items using it. You can
download this utility using the following link:

<http://support.microsoft.com/kb/290301/>
