Hello, All

Is there a way to change the sa password in SQL 2005 without knowing the existing password?

I tried everything I can find online to change the password but nothing works.

This is on my test server so I am opened to anything.

Thank you.

You could use SQL Server Management Studio, connect with windows-authorization to the server/instance, then under Security/Login (i don't know exactly the names, i have a german version), you can right-click on "sa", select "properties" and then you can change the password.

bye, Helmut
