I am a Oracle DBA new to SQL Server. We actually have a small MSDE database running here. How do I select records for update so if somebody tries to updates I have locked they will get an error.

In Oracle I would just do:

```
select column1
from mytable
for update
```

In sql server I try to do the same thing but it does not lock them. I am also selecting the records in a cursor. So I really want all the records in the cursor to be locked no matter what record I am reading at the time. If somebody could help me out I would appreciate it.

Thanks

Jeff
