Thanks for you reply

but this doesn't seems to me a good solution : there will be hundreds of lines in the files, and a lot of servers to manage in a very near future. This solution would be just working temporarily (a few servers), but not on a larger scale. Do you know if MOM would allow to get all these performance counters for a hundred servers ? What price would it be ?

Thanks for your help.

Well the only other thing I can think of is to log to a character format (CSV etc.) and edit the file by replacing those offending quotes with something else before importing with Relog to the table.

Andrew,

I tried csv, tsv, blg and circular blg...it doesn't make any difference. Still the ' error.

Any other possibilities ?

Xavier

What type of file are you using to log to, Binary? All I can think of is to try different file types to see if there is one that works better with ODBC.
