Hi,

I was wondering if anyone out there can help me with the following problem:
I've written an annotated XSD for retrieving some related tables from
sql-server.

It's used in an XPATH Query that populates a strongly typed dataset
(generated using xsd.exe).

So far everyting works like a dream!

There is however one nagging problem i've encounterd so far. I'm trying to
"deassign" a child from it's parent by updating it's foreign key field to
null (by using the setnull method generated by xsd.exe).

The dataset records this but when I use it to try to update the database, no
update statements are executed and no errors are raised.

Updated the child with a different parent key does however work!!!

So it would seem SQLXML doesn't detect a change when updating to null?!

Any help would be greatly appreciated.

Regards, Rob Huibers
