Also, if you are allowed to change the collation in the database something like this will also allow the £ character in your xml to be read without changing your code.

```
ALTER DATABASE DatabaseName COLLATE SQL_Latin1_General_CP1250_CI_AS
```

Or change your code to load the VARCHAR as follows:

```
DECLARE @m VARCHAR(8000)
SELECT @m = '<B><A>£100</A></B>' COLLATE SQL_Latin1_General_CP1250_CI_AS
DECLARE @h INT
exec sp_xml_preparedocument @h OUTPUT, @m
```

And this will work.

In any case you have to be sure that the collation you use makes sense for the string you are passing into SQL Server.

Without seeing the actual xml you are trying to load its only possible to guess at what the problem is...

The problem probably is that the xml parser inside of is using the code page configured for your instance of SQL Server, which doesn't support the £ symbol. For example:

```
DECLARE @m VARCHAR(8000)
SELECT @m = '<B><A>£100</A></B>'
DECLARE @h INT
exec sp_xml_preparedocument @h OUTPUT, @m
```

Will produce:

Re: XML and Pound (£) Symbol

The XML parse error 0xc00ce508 occurred on line number 1, near the XML text "<A>".

Msg 6602, Level 16, State 2, Procedure sp_xml_preparedocument, Line 1
The error description is 'An invalid character was found in text content.'

Because of the code page setup for SQL Server. However if you can use NVARCHAR instead of VARCHAR the xml will be interpreted as Unicode which the xml parser in SQL Server can handle. For example will produce no error:

```
DECLARE @m NVARCHAR(4000)
SELECT @m = '<B><A>£100</A></B>'
DECLARE @h INT
exec sp_xml_preparedocument @h OUTPUT, @m
```

Of course with NVARCHAR you can only handle 4000 characters.

If you can modify the incoming xml you can specify an encoding that supports the £ character, for example:

```
DECLARE @m VARCHAR(8000)
SELECT @m = '<?xml version="1.0"
encoding="ISO8859-1"?><B><A>£100</A></B>'
DECLARE @h INT
exec sp_xml_preparedocument @h OUTPUT, @m
```

Will allow the xml to be read without an error.
