Greetings,

I have run into an unusual error for one specific user who's permissions have been granted via the public role.

Background: All data accessed via the asp.net application have been set to stored procedures. 4 users have been assigned to the public role and permissions to all relevant stored procedures have been set. All users except one have no problem accessing data via the stored procedures available.

Problem: One user gets an error that they don't have appropriate permissions set to access the underlying table or view that is called via the stored procedure.

I have double checked all SQLCommands and or SQLDataAdapters as well as the public permissions list and I can't find anything. Besides, if it were a problem in the application, every user would get this error.

Any feedback in regards to why this one user is encountering this error would be greatly appreciated.

Thanks in advance for you help!

-MadMax
