Is your SQL Server Agent running? If not, you should run it first for the sheduled job.

I think that why the Next Run Date column says "(Date and Time are not unavailable)".

Thanks,

Atkins wrote:

I'm assisting someone who started having trouble with most of their scheduled SQL jobs not running after they moved their server to a new location/plant. As a side note, my understanding is the servers belong to their own domain so this move should not have affected things too much.

Furthermore, the Jobs do not seem to run when you right click and choose start job. There is no indication of success or failure The Next Run Date column says "(Date and Time are not unavailable)" and Last Run Status column says "Unknown". "View Job History..." says "There is no history information for this job".

I have created a new Test job with one step and one line containing a print statement. On the Step's Advanced tab I set it to output to a file. However, again there is no sign that the step was executed. Because the file was not created and the Job status and history still displays the same messages. I should also mention that this was using the same owner as the other jobs that are working and that the owners I've tried are sysadmins. One is a windows account and the other is a SQL Account. The jobs that are working are using the SQL Account.

The Server is SQL Server 2000 RTM (no Service packs installed) on Windows 2000 Standard w/ SP3

Thanks for any help!
