Hi,

I want to capture the Create, Alter and Drop Events of all the database objects, and in addition to that I have other events too.

I was trying to use the "Audit Object Derived Permission Event" event for capturing the Create, Alter, Drop of Tables, SP's and Views. But it doesnt capture the Create event while its documented that it should do so. It captures the Alter and Drop Event as expected.

Web Reference :

[http://msdn2.microsoft.com/en-us/library/aa173905\(SQL.80\).aspx](http://msdn2.microsoft.com/en-us/library/aa173905(SQL.80).aspx)

[http://msdn2.microsoft.com/en-us/library/aa173910\(SQL.80\).aspx](http://msdn2.microsoft.com/en-us/library/aa173910(SQL.80).aspx)

As seen from the above pages it is evident that microsoft says it should get audited, but it doesnt, does anybody has a clue as to what is wrong.

Note: I could have used the Object:Created Event but I needed the database name also which according to the documentation will not given by the trace.

.
