Hello, I have a user who cannot connect to SQLserver2005 through an ODBC link. The message is: "The user is not associated with a trusted SQL server connection. I have perused the knowledge base and checked that server authentication is dual mode. It is. I have also checked the SQLserver log and found that each time this user tries to log on we have: "Login failed for user ". The user is not associated with a trusted SQL Server connection. [CLIENT: 10.0.0.102]".

We also have this error message every 2 minutes: "Login failed for user 'sa'. [CLIENT: 10.0.0.12]" since 8 days ago when we installed a new domain server.

We have a separate server for SQLserver. It was restarted after installing the new domain server.

I also tried dropping and recreating the user account giving trouble on SQLserver. It didn't work.

I have also noticed when creating a new user that SQLServer2005 doesn't look up the user list from the domain server. (SQLserver2000 used to I think). I have to type in a domain\user. Why is this?

Any help would be appreciated.

Thanks, Shane.
