Hi all,
I am new of the group and I hope that you can help me to resolve the "problem" that plagues me...
I must unload the data of many tables (... some of which rather large...) from 4 DB ORACLE on my SQL Server 2005...
I have created therefore 4 linked server on my SQLServer that is connected to the 4 DB Oracle... Then I have created some task (using SSIS) that they execute one banal instruction of

```
SELECT * INTO NomeTabella FROM LinkedServer.  
Schema.NomeTabellaOracle
```

where NomeTabella represents my physical table.
Executing then all the task at the same time I see that the task effectively all are activated entirety, but...
when I try to verify as they come executed the operations, I see that several SELECT INTO come executed one after the other and NOT in parallel...
Also watching the data traffic on the net I see that the tables come tried, created and filled up one for time and NOT in parallel...
Exists a way in order to execute in parallel the instructions of

Re: Multiple Select Into

SELECT INTO?

Unfortunately I cannot use the dataflow task of the SSIS because these SELECT INTO come shaped in dynamic way (what that I succeed to make only creating "by hand" SQL instruction).

Bye and thanks !
