Disabling the local machine lockdown just lets active content (client script) run. It does not allow script to create/use unsafe ActiveX components which is what you are trying to do.

Non-http content (content accessed via explicit/implicit file:// protocol) will be in the local computer zone if accessed from a local hard drive. It will be in the intranet zone of accessed via a UNC path or a mapped network drive. Enabling use of unsafe ActiveX components in IE from either of those zones is ill-advised.

You would be better off pursuing an HTA solution (hosted by mshta.exe, not iexplore.exe).

HTML Applications (HTA)
