Is an html document. DOM is a tree that can contain different nodes, like Elements, Attr, Comments, DocumentFragment and Text. I know the name or ID for the node I need but I dont know how to reference the node by ID since there's no GetNodeByID function....just GetElementByID

Alex D. wrote:

but I need to be able to get all kind of DOM nodes and not only Elements.
I also need Comments, Attr, Text...etc

What is the name of a comment or text node in your understanding?
Are you searching in a HTML document or in an XML document (where the latter might allow XPath searches)?
