-

I am having a few problems at the moment with passing variables through URLs between two html files without using an ASP. Currently, I have several hyperlinks on page1.html such as:
page2.html?id=3§=2
page2.html?id=9§=3

Is there anyway on page2.html in Vbscript that i can retrieve the values for the 'id' and 'sect' object specified in the URLs?

At the moment I am currently trying to output the objects and values to the screen but having no luck with it at all. Does anybody have any ideas?

.
