Hello,

I'm trying to find/write a script that can return the members of the Local Administrator group on Win 2K/XP machines. I have an active directory 2003 domain environment and basically want to be able to generate a text file that lists the computers in my domain with the Domain users that belong to those computers' local Administrator group. Very new to Windows scripting, and I can't figure out how to pull the users from the local administrator group. I'm thinking I need to use WMI which is new to me as well. Any help is most appreciated.

.
