Using VBS I need to search the AD on a Win2K server and for each name in an OU, check to see that a personal folder has been setup. If not then I need to create the folder on the server and set the permissions correctly. [Note that the VB script will be run on the server.] OK, but here is the problem: I need to set the folder permissions so that only the administrators group and that person in the AD have full access permissions and nobody else has no access to it. How do I do it in vbs?

Thanks very much for your reply,

Brooks
