Actually, the script you mention above sounds like exactly what I am looking for. I would be very interested to see it (the email account listed for my name is a valid account)

Although I believe I found a working tool, srvcheck.exe from the Windows 2003 server resource kit. It claims to enumerate all shares on a specific server, with permissions, but I would still love to see how it could be done in a script.

Thank you  
Tim
