Hello,

First of all, let me state that I am not a coder, so if the answer could be in layman's terms, that would be much more helpful. I have been working on this little project that basically should grab two words from the subject of an email (first word = command to be processed, second word = servername), pass those as variables to a batch file, have the batch file do it's magic, then send a return email with the results of the commands. I have been working on this for a week now, and can't seem to figure this out. Any and all help will be GREATLY appreciated.

Here's what I have so far:

Ex. An email comes in, with the subject "IISRESET <servername>"

Then, an Outlook rule will recognize the word IISRESET and call this vbs file:

--Outlook.vbs--

```
Set oSession = CreateObject("MAPI.Session")
oSession.Logon , , False, False, 0
```

```
Set oFolder = oSession.Inbox
Set oMessages = oFolder.Messages
```

```
Set Msg = oMessages.GetFirst
```

```
While Not Msg Is Nothing
If Msg.Unread = True Then
strSubject = Msg.Subject
arr = Split(myItem.Subject, " ")
strActionToTake = arr(0)
strServerToActOn = arr(1)
end If
Set Msg = oMessages.GetNext
```

```
Option Explicit
Const = Command
```

I need professional help!!

```
Command = "J:\IISResetBatchFiles\iisreset_test.bat"
Dim strPath
strPath = arr(0)
Dim Server
Server = arr(1)
Dim strRUN
strRUN = "%comspec% /c " & Command & " " & strPath & " " & Server
Dim objWSS
Set objWSS = CreateObject("WScript.Shell")
objWSS.Run strRUN, 0, True
Set objWSS = Nothing

Set WSW.run = CreateObject("WScript.Shell")
wsw.Run "J:\IISResetBatchFiles\iisreset_test.bat"

oSession.Logoff
Set oSession = Nothing

Wend
```

Now, the two variables mentioned above should be passed to the batch file below:

--IISRESET\_TEST.bat--

```
set command = %1
set server = %2
psexec.exe %1 -u ***\***** -p *****
echo "IISRESET" > "C:\iisreset.txt"
pservice %2 query iisadmin >> "C:\iisreset.txt"
pservice %2 query w3svc >> "C:\iisreset.txt"
pservice %2 query smtpsvc >> "C:\iisreset.txt"
bmail -s blah.blah.blah.com -t username@xxxxxxxxxxxx -f
username@xxxxxxxxxxxx -h -a "Internet Information Services Reset Output"
-m c:\iisreset.txt
```

This batch file should perform the first variable as a command (in this case, IISRESET) and the second variable being the server. Once done, bmail will send the results back to myself. I have this working without the variables, but that means I have to create a separate batch file for each server. We have hundreds of servers, so this is not a preferred way. Please help!! Thank you.
