Rem out the "On Error Resume Next" statement by putting an apostrophe before the line. Then rerun the script. It will crash at the exact point where the problem is occurring and it will tell you the line number.

This will help you troubleshoot the problem. The reason it is not crashing now is that the "On Error Resume Next" causes VBScript to ignore any errors and move on to the next command.

As a general rule, you should not run your entire script with error checking turned off. If you have a function that may fail, you can turn off error checking with "On Error Resume Next" and then immediately after the function finishes, turn error checking back on with "On Error Goto 0"

.
