Hello,

Based on the source internet address a different version of the website should be presented/served to the user/browser.

For example in pseudo code:

```
if SourceAddress = '143.3.5.1' then
begin
ShowBlueWebsite; // Load/Show BlueIndex.htm
end else
if SourceAddress = '124.5.15.7' then
begin
ShowRedWebsite; // LoadShow RedIndex.htm
end;
```

Is this possible with visual basic script ? is there any source code available to do this trick ?

Bye,
Skybuck.

.
