When a user is logged on, the NTUSER.DAT for that user is in use. This file contains the HKCU registry hive for the user. So, there is no way to copy the file to a different location.

Are you logging in as the workgroup user or domain user? If you are logging in as workgroup user, you will not be able to copy the folders to the Username.Domain folder. You will need to do this using another account that has admin access with the workgroup user logged off.

hope this helps

Hi all,

I am learning to use VBScript to create a Windows logon script. Right now, we are in the process of moving from a workgroup to a domain, so everyone has a local profile on the copmuter with their desktop and favorites, etc. What I want to do is have it so that when the users first log on to the domain, it will copy their Desktop and Favorites from their old profile to the new one (in this case it is C:\Docs and Settings\Username to C:\Docs and Settings\Username.MYDOMAIN)

Anyway, I thought I had this all nice and good as it worked fine when I tried logging in. When I tried logging in as a different user, however, I get a path cannot be found when I try to grab a folder object (ie objFSO.GetFolder(strSource)).

The only thing I can think of is that maybe this is some type of permissions problem? I think this because when I tried to open up C:\Docs and Settings\Username when the user was logged on I get an "Access is Denied Error." I, on the other hand, am an admin/domain admin and have no problem getting to other profiles on this computer.

I tried making the user a local admin, but I still got the same problem in the script and still am unable to open C:\Docs and Settings\Username.

Re: Copying folders

Any ideas?

Thanks for the advice!
