CDO would be server-side, but yes... this would work.  
you could list the files available on the server and have the users  
select  
the ones they want to send.  
then your serverside vbscript (ASP) script could attach the documents and  
send the email.

all actually very simple and there are simple examples available

"Andrew Butchart" <and...@xxxxxxxxxxxxxxxx> wrote in message

Actually I need to do it client-side. I can make the pdf documents  
available to the local file system, but the person sending the email  
needs to add on a bunch more information about the order and we need  
it to come from their email address.

AndrewB

"from their email address" <> from their PC  
There should be no problem setting the "from" on the server to the address  
of the person using the system...
