In the statement:

```
Set objFile = objFSO.OpenTextFile(strFilePath, 2, True, 0)
```

the second argument, 2, means to open the file for writing. This overwrites. Use 8 to append.

No problem, I did some looking and noticed that. I do have a further question, I'll explain a bit of what I'm doing.

Basically another script calls this script, if certain conditions are met, the problem I'm running into now, is the second time the script is called(which it could be called a lot of times. It overwrites the values already in the text file, ie the first time ran the script enters: HFXVMTEST1\$; 11/8/2006 7:55:20 PM, then it will be overwritten the next time it's called. I need it to append to the file, rather than overwrite, is this possible? Thanks.

Sorry, I forgot that all computer objects have sAMAccountName equal to the NetBIOS name of the machine with "\$" appended on the end. I believe it is to ensure no conflict with other objects, like users or groups, since sAMAccountName must be unique in the domain.
