- 

i want to check the event log for a specific event id. chances are it wont exist. if it does NOT exist i need to echo "not found" if it does exist i need to echo the date property of the event, but only for the first one found, then i can exit.

i cant for the life of me figure this out. i though maybe colEvents.EOF but that doesnt exist.

```
intEventCode = 170456
strLog = "Application"
strComputer = "xpvirtual01"
set objWMI = GetObject("winmgmts:\\\" & strComputer & "\root\cimv2")
set colEvents = objWMI.ExecQuery("Select * from Win32_NTLogEvent Where Logfile = \" & strLog & \"
and EventCode = \" & intEventCode)
```

```
if a single event 170456 was found
echo event.date
Else
echo no events found
end if
```

i know ill probably need a for each loop, or is there a way to only return 1 event from the query? like a SELECT TOP 1 or something?

thanks

.
