This should help you out Glenn. Watch word wrap of course. This can be modified to attach to other computers and drives if needed. Right now it looks for xls files under c:\scripts\excel(\\Scripts\Excel\). Good luck.

```
strComputer = "."  
Set objWMIService = GetObject("winmgmts:" _  
& "{impersonationLevel=impersonate}!\\" & strComputer & "\root\cimv2")
```

```
'Location of xls files  
Set colFiles = objWMIService._  
ExecQuery("Select * from CIM_DataFile where Path = '\\Scripts\Excel\  
and Extension = 'xls'")
```

```
Set objExcel = CreateObject("Excel.Application")  
Set objNewWorkbook = objExcel.Workbooks.Add
```

```
i = 1  
For Each objFile in colFiles  
Wscript.Echo objFile.FileName  
Set objWorkbook = objExcel.Workbooks.Open(objFile.Name)  
objExcel.Visible = True
```

```
Set objRange = objExcel.Range("B3", "B11")'Range of data you want to capture  
objRange.Copy  
objWorkbook.Close
```

```
objNewWorkbook.activate  
objExcel.Cells(1,i).Select  
objExcel.ActiveCell = objFile.FileName 'Name of file data was copied from  
objExcel.Cells(2,i).Select  
objExcel.ActiveSheet.paste  
i = i + 1
```

```
Next
```

Re: combining excel worksheets

objExcel.Cells(1,1).Select

I have a folder that contains several excelworkbooks.

Each of the workbooks contains a worksheet that has similiar  
"fields" of  
data (in the same columns) as the other workbooks, but  
different data.

Is there a way to run a script that will create a new workbook  
/ sheet  
that reads all the data from the rest of them and  
makesonecombined  
sheet?

Thanks.

You could create a VBA script that does what you want.  
The newsgroup microsoft.public.excel.programming (or something like that)  
might help you with VBA, and you may find the VBA help you need here  
too.

This is a VBScript group, so I'm assuming you want a VBScript-only  
solution.  
A recent post demonstrated how to use VBS and ADO (builtintomost recent  
Windows OSs) to use SQL statements to extract info from an access  
database,  
putting the resultintoa .CSVfile, then uses SQL to copy the info from the  
..CSVfileto a number of sheetsin a workbook (XLSfile) that the script  
creates. You can find this VBScript by searching groups.google.com for  
everything on the following line:  
ekkehard nordwind group:\*.scripting.vbscript  
Hopefully someone will post a snippet that demonstrates extracting info from

## Re: combining excel worksheets

a sheet in a workbook, and then you will have all the pieces to do what you want.

I have an excel workbook that contains MANY identical worksheets/tabs that I would like to combine into one .csv file (because its too many rows for .xls) using a macro of some sort. Along with that i would like it to remove the header row from the 2nd worksheet/tab going forward, so that in the end I have one .csv file with a header row and all the subseqent combined data. any ideas?

.
